

FieldPro Brand Awareness Dashboard — handoff to Miry

TL;DR: I need you to grant a service account read access to GA4 and Search Console. Two short tasks, ~2 min total. Details below.

What I need from you

Both tasks need admin/owner permissions I don't have. Both grants are read-only — the dashboard only reads data, never writes.

1 • Add the service account to GA4

In GA4 (FieldPro Webflow Site property, ID `397004121`):

→ **Admin** → **Property access management** (under the Property column)

Click the + button and add this email as a **Viewer**:

`fieldpro-dashboard-reader@fieldpro-dashboard.iam.gserviceaccount.com`

Uncheck "**Notify new users by email**" — it's a service account, not a person.

2 • Add the same service account to Search Console

In Search Console (`fieldproapp.com` property):

→ **Settings** → **Users and permissions**

Click "**Add user**" and add the same email above. Set permission to **Restricted** (read-only is enough for our use case).

That's it. Once both are done, I'm unblocked.

Context (in case useful)

I'm building an internal dashboard to track our shift from brand-dependent traffic to organic-driven growth — basically a simpler, more actionable view of GA4 + Search Console focused on a few specific metrics:

- Non-brand organic sessions (the primary metric)
- LLM referral sessions (AEO scoreboard)
- Combined "already aware" sessions (brand organic + direct)

- Total demos and demos from organic+LLM sources

Plus diagnosis panels for landing pages, search queries, and home-page engagement. The dashboard will (in a later step) use the Claude API to generate plain-English commentary on what's moved and what to do about it.

For my weekly self-review and occasional manager updates. Not customer-facing.

What's already set up

- Google Cloud project `fieldpro-dashboard` (under optimetriks.com org)
 - Google Analytics Data API enabled
 - Google Search Console API enabled
 - Service account `fieldpro-dashboard-reader` created
 - JSON credentials downloaded and stored locally on my machine
 - Dashboard mockup designed, metrics finalized (happy to walk you through it if curious)
-

What I'll do after you grant access

1. Wire up the dashboard code (Python + Streamlit) pulling real data from both APIs
 2. Verify the numbers match what we see directly in GA4 and Search Console
 3. Add Anthropic API key for the AI commentary layer (separate billing — TBD with the team)
 4. Deploy to Streamlit Community Cloud (free tier)
-

Where you might come in later

Probably nowhere — the dashboard runs on free infrastructure, doesn't touch production, and I have AI assistance for the build itself. But if you have time:

- A quick code review before deployment would be appreciated (not blocking)
 - If I hit an edge case on deploy, I might ping you (most likely won't need to)
-

Reference

GA4 property ID	397004121
GA4 property name	FieldPro Webflow Site
Search Console property	fieldproapp.com
Google Cloud project	fieldpro-dashboard
Service account	fieldpro-dashboard-reader@fieldpro-dashboard.iam.gserviceaccount.com

Let me know once access is granted and I'll continue. Thanks!
